

SERVERLESS CLOUDFLARE

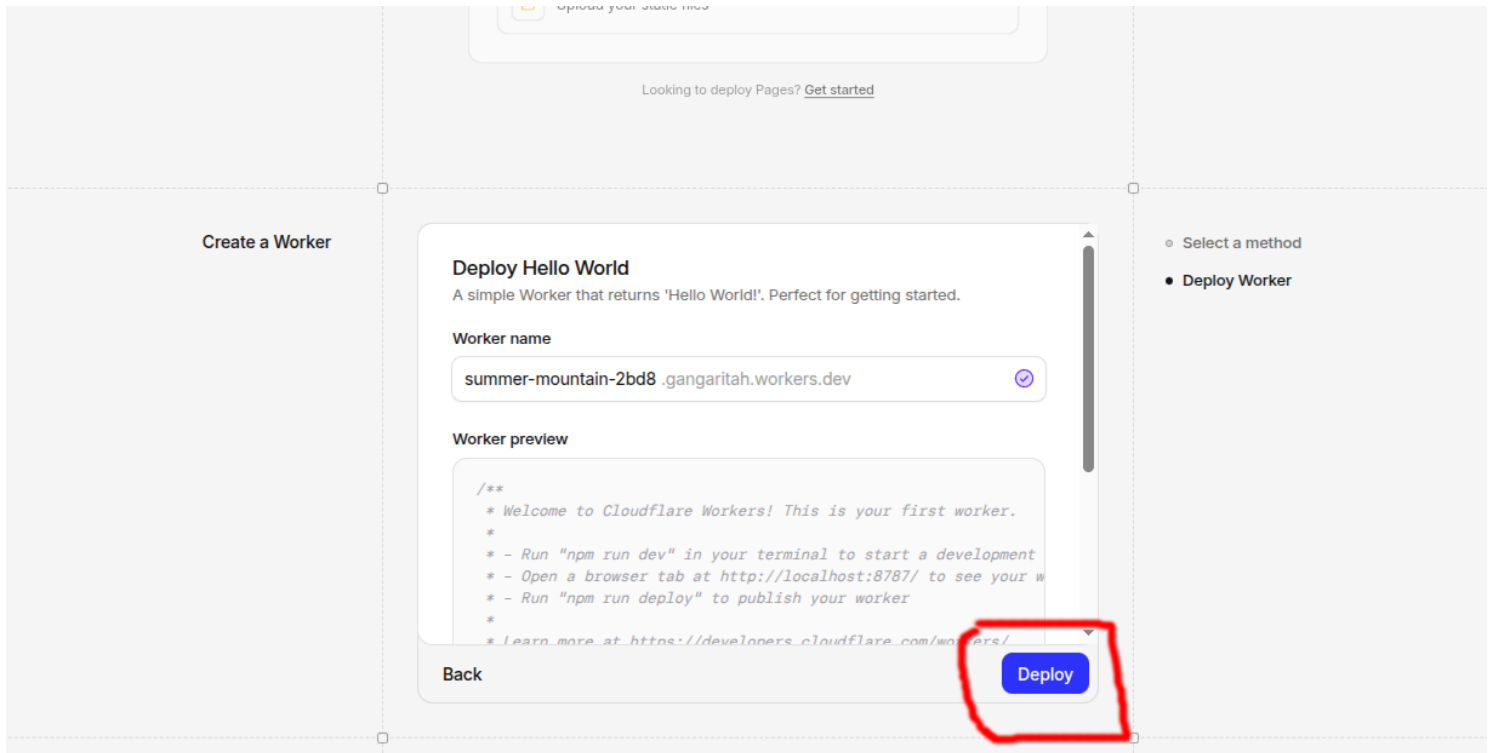

Nos dirigimos a <https://www.cloudflare.com/> y creamos una cuenta, luego iniciamos sesión

Vamos a workers que es un servicio serverless de Cloudflare

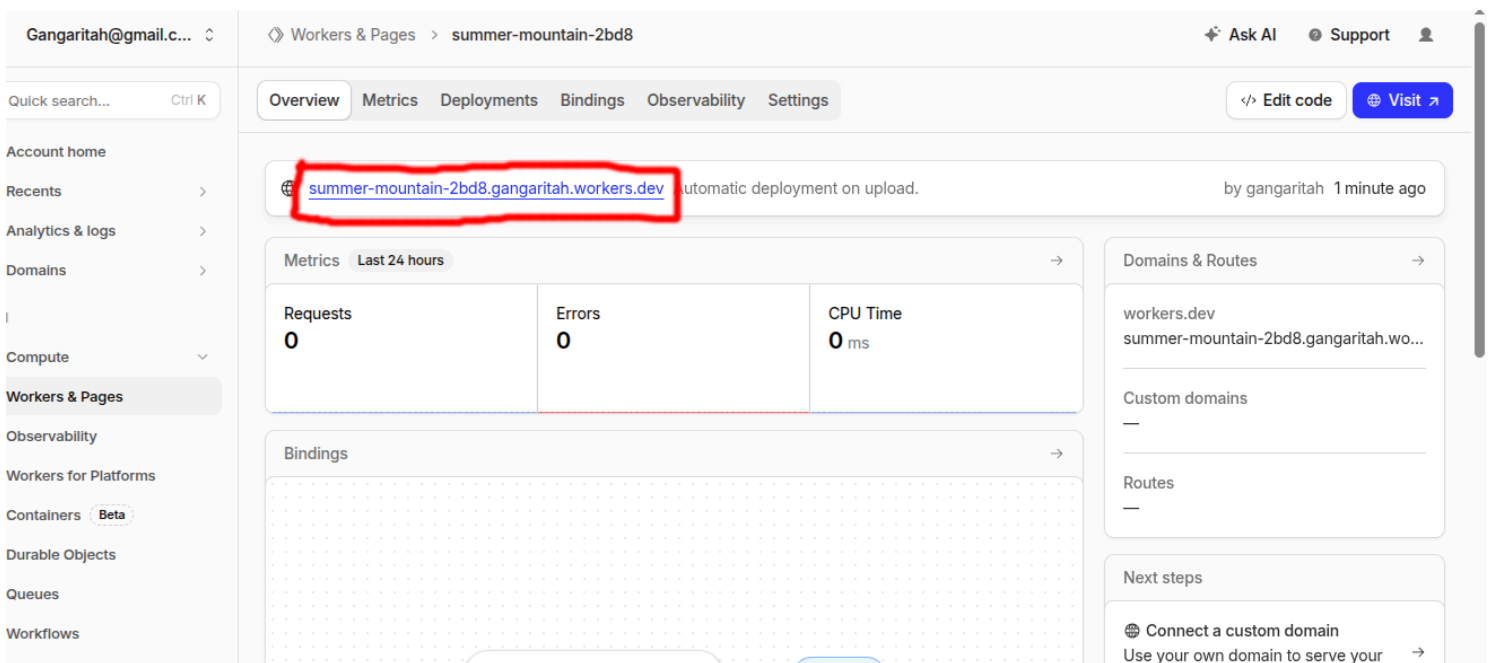

Creamos una app serverless con plantilla hola mundo

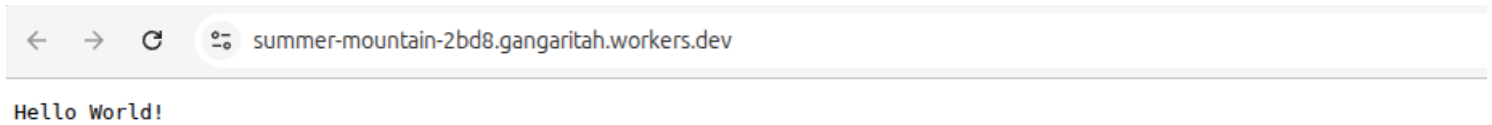

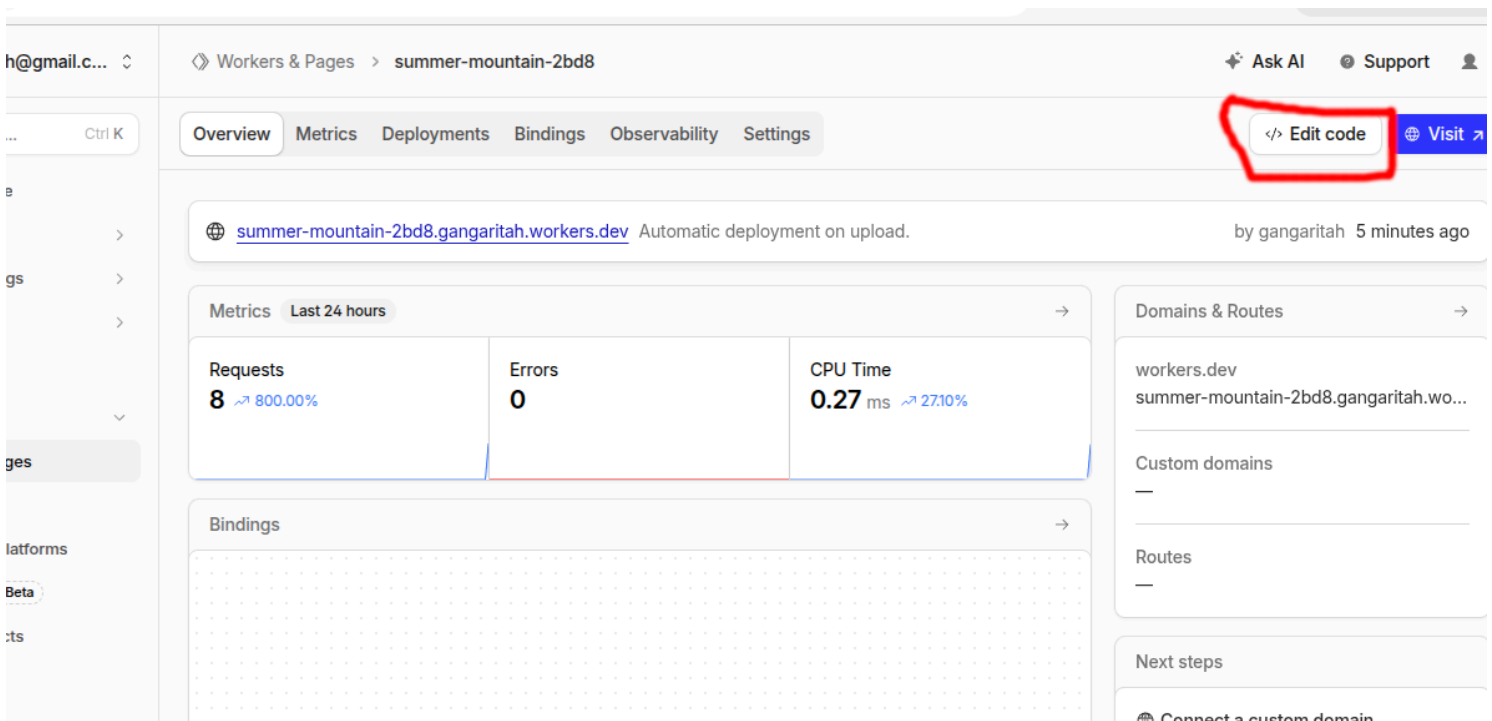

Esperamos aproximadamente 30 segundos a que nuestra serverless se despliegue, luego hacemos click en la url de la app

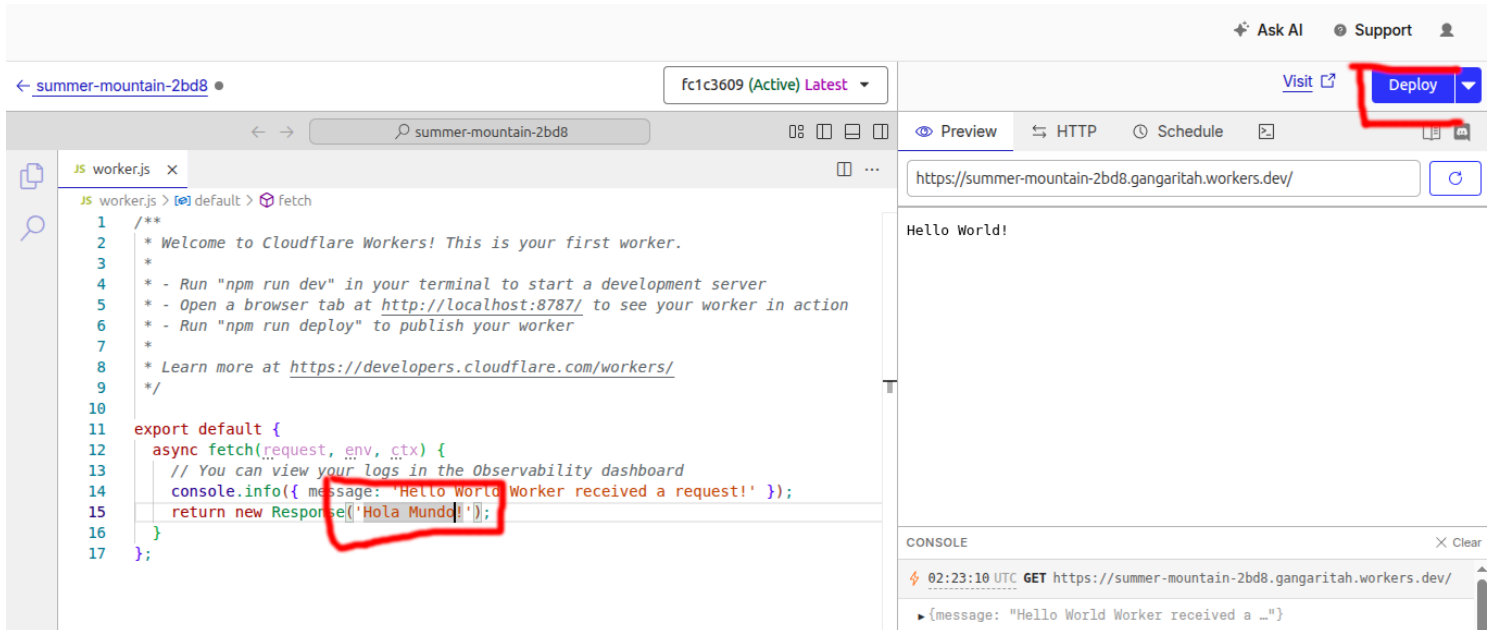

Nos debe salir nuestro Hello World! como respuesta. Nuestra serverless está funcionando

Para editar el código y hacer redeploy:

Cambiamos a español la salida y hacemos deploy nuevamente

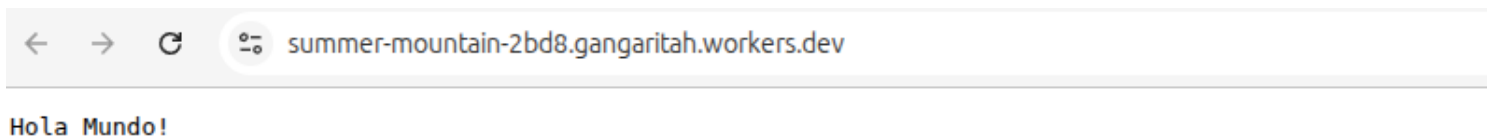

The screenshot shows the Cloudflare Workers interface. On the left, the code for the worker is displayed in a text editor. The code is a JavaScript file named `worker.js` that uses the `fetch` function to handle incoming requests. The code is as follows:

```
1 /**
2  * Welcome to Cloudflare Workers! This is your first worker.
3  *
4  * - Run "npm run dev" in your terminal to start a development server
5  * - Open a browser tab at http://localhost:8787/ to see your worker in action
6  * - Run "npm run deploy" to publish your worker
7  *
8  * Learn more at https://developers.cloudflare.com/workers/
9  */
10
11 export default {
12   async fetch(request, env, ctx) {
13     // You can view your logs in the Observability dashboard
14     console.info({ message: 'Hello World Worker received a request!' });
15     return new Response('Hola Mundo!');
16   }
17 };

```

On the right, the preview of the worker is shown. The URL is `https://summer-mountain-2bd8.gangaritah.workers.dev/` and the response is `Hello World!`. A red box highlights the `Deploy` button in the top right corner of the interface.

Visitamos nuevamente la url y la salida ha cambiado

The screenshot shows a web browser with the address bar containing the URL `summer-mountain-2bd8.gangaritah.workers.dev`. The page content displays `Hola Mundo!`. A red box highlights the output text.
